

# Moving Object Segmentation for Security and Surveillance Applications

Goksel Dedeoglu, Ph.D.

Darnell J. Moore, Ph.D.

Vision R&D, Texas Instruments, Inc.

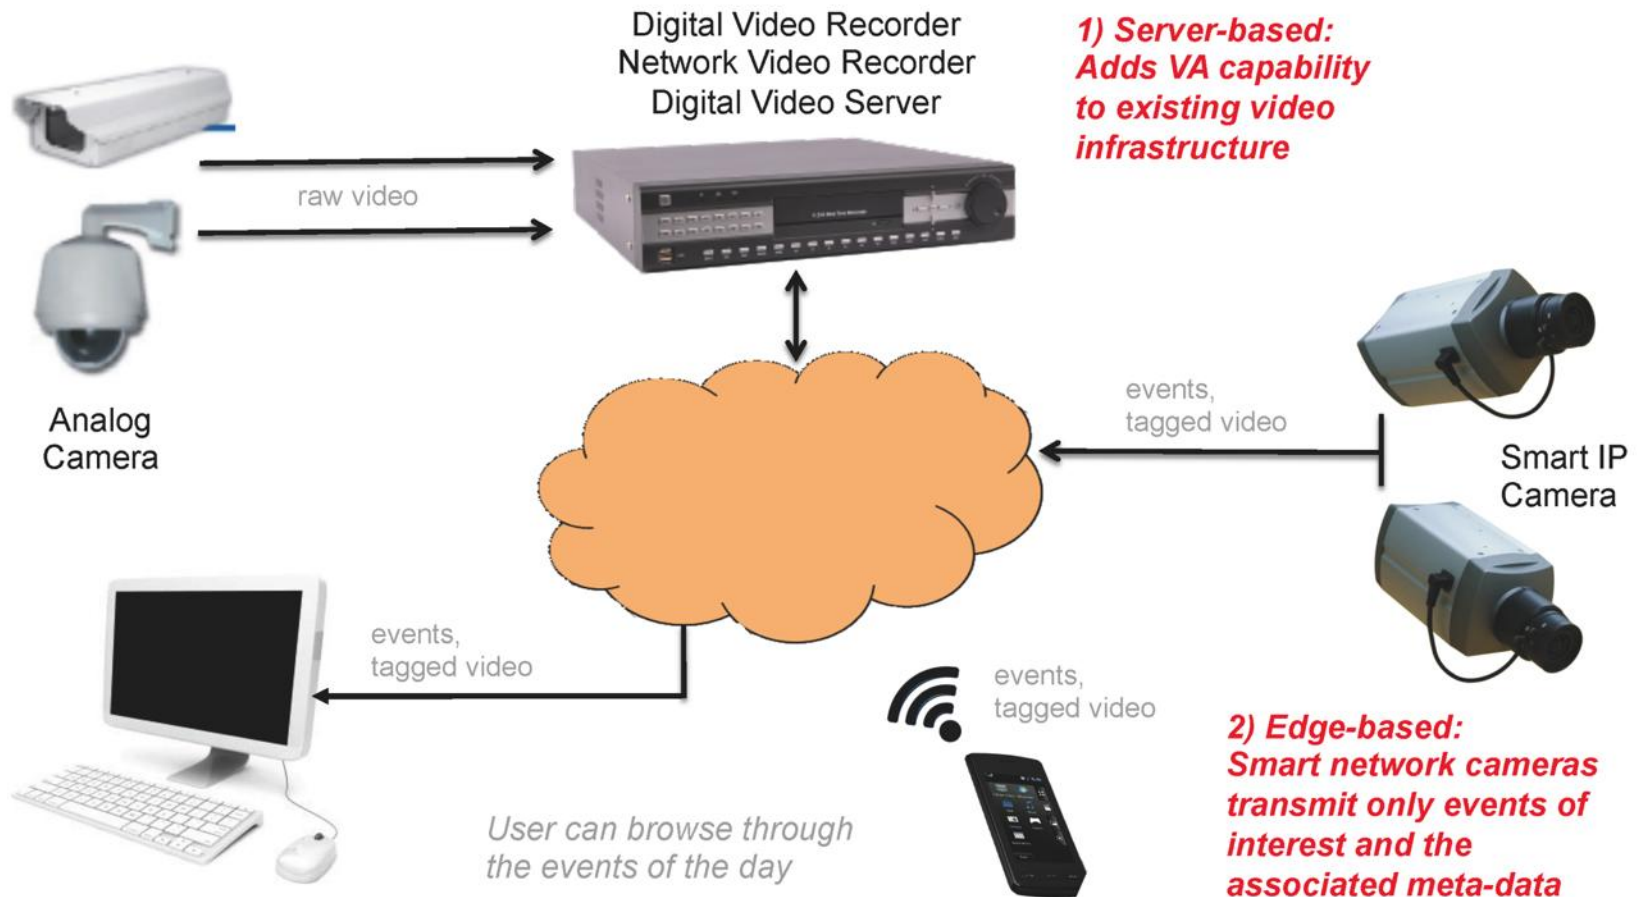

# Motivation

- Cameras are everywhere
  - Public spaces, malls, offices, retail stores, public transport, ....
  - More cameras than eyes to monitor video

- Long-standing goal of *computer vision*
    - Let computers analyze all the video
    - Alert the user only when anything of interest is detected
- } *Video Analytics (VA)*

# Cost-effective platforms for Video Analytics

# Challenges

- Application performance
  - Real-time detection of events
  - Low tolerance for false alarms or misses
- Algorithm
  - Unknown camera viewpoint
  - Unconstrained, varying scene illumination
  - Environmental factors (rain, camera movement, ...)
  - Minimal user input
- Compute platform
  - Low power, low cost, high performance
  - Programmable for diverse vision functions
  - Many peripherals to interface other devices
  - High resolution video at 30fps

# Example: Moving Object Segmentation

*Common question in video management: is anything happening?*

# The Role of Moving Object Segmentation

# An Approach for Moving Object Segmentation

*Common bottleneck for requirements including video analytics and intelligent occupancy sensing*

# Algorithms for Moving Object Segmentation

# Need for efficient embedded implementation

**VLIB off: utilizing 14.5% total processing power, 86 MHz**

MOS	DSP	86.06	MHZ	VIDEO	320x240	FORMAT	
VLIB OFF	LOAD	14.5	%		10	FPS	
VLIB FUNCTION NAME							
		Cyc/Pix	AvgMHZ				
VLIB_ConvertUYUVtoLuma		= 1.19	0.92				
VLIB_subtractBackgroundsS16		= 16.21	12.43				
VLIB_erode_bin_square		= 22.88	17.54				
VLIB_dilate_bin_square		= 22.24	17.07				
VLIB_updateEWRMeansS16		= 17.13	13.18				
VLIB_updateEWRVariancesS16		= 23.20	17.81				
VLIB_CreateCCList		= 3.77	2.85				
VLIB_CreateCCMap8		= 0.00	0.00				
Overhead (framework, etc.)		= 6.02	4.52				
MOS TOTAL (Running-Avg)		= 112.64	86.32				

**VLIB on: utilizing 1.6% total processing power, 9 MHz**

MOS	DSP	9.31	MHZ	VIDEO	320x240	FORMAT	
VLIB ON	LOAD	1.6	%		10	FPS	
VLIB FUNCTION NAME							
		Cyc/Pix	AvgMHZ				
VLIB_ConvertUYUVtoLuma		= 0.38	0.30				
VLIB_subtractBackgroundsS16		= 1.32	1.01				
VLIB_erode_bin_square		= 0.20	0.16				
VLIB_dilate_bin_square		= 0.20	0.16				
VLIB_updateEWRMeansS16		= 1.16	0.90				
VLIB_updateEWRVariancesS16		= 1.37	1.05				
VLIB_CreateCCList		= 1.80	1.38				
VLIB_CreateCCMap8		= 0.00	0.00				
Overhead (framework, etc.)		= 6.02	4.62				
MOS TOTAL (Running-Avg)		= 12.45	9.58				

**DSP-optimized Vision Library (VLIB) provides 10x performance improvement over C code**

# Moving Object Segmentation performance on a TI DSP

## C64x+ MHz requirements (\*)

	@ 5 fps	@ 10 fps	@ 30 fps
QVGA	5	9	27
CIF	6	11	36
VGA	18	36	108
D1	21	41	123
HD 720p	54	110	333
HD 1080p	122	245	735

(\*) 16-bit precision, single-Gaussian model @ QVGA resolution,  
VLIB turned ON, 50% overhead assumed

# Embedded algorithm design considerations

**1. High granularity:** small & well-understood operations.

**2. Fixed-point:** optimal use of Single-Instruction-Multiple-Data features of embedded DSPs.

```
int VLIB_recursiveFilterHoriz1stOrder(  
    char *out,  
    char *in,  
    int width,  
    int height,  
    short weight,  
    char *boundaryLeft,  
    char *boundaryRight,  
    char *buffer);
```

**3. Data traffic:** Direct Memory Access friendly APIs.

# VLIB functions by category

## • Background modeling & subtraction

- Luminance Extraction from YUV:422
- Exponentially-Weighted Running Mean & Var.
- Uniformly-Weighted Running Mean & Var.
- Statistical Background Subtraction
- Mixture of Gaussians Background Modeling & Subtraction
- Morphological Operations (Erosion & Dilation)
- Connected Components Labeling

## • Feature extraction

- Harris Corner Score (7x7)
- Hough Transform for Lines
- Histogram Computation for Integer Scalars
- Histogram Computation for Multi-Dim. Vectors
- Weighted Histogram for Integer Scalars
- Weighted Histogram for Multi-Dim. Vectors
- Legendre Moments
- Canny Edge Detection
  - Smoothing
  - Gradient computation
  - Non-maximum suppression
  - Hysteresis

## • Low-level pixel processing

- Color Conversion YUV:422 interleaved to
  - YUV planar
  - RGB
  - LAB
  - HSI
- Integral image
- Image Pyramid (2x2 block averaging)
- Non-Maximum Suppression (3x3, 5x5, and 7x7)
- Gradient Image Pyramid (5-tap)
- Gaussian Image Pyramid (5-tap)
- First-Order Recursive IIR filters (horiz. & vertical)
- SAD-based disparity for stereo

## • Tracking, recognition, etc.

- Lucas-Kanade Feature Tracking (7x7)
- Kalman Filtering
- Nelder-Mead Simplex optimization
- Bhattacharya distance

# Challenges (revisited)

- Application performance
  - Real-time detection of events
  - Low tolerance for false alarms or misses
- Algorithm
  - Unknown camera viewpoint
  - Unconstrained, varying scene illumination
  - Environmental factors (rain, camera movement, ...)
  - Minimal user input
- Compute platform
  - Low power, low cost, high performance
  - Programmable for diverse vision functions
  - Many peripherals to interface other devices
  - High resolution video at 30fps

***Demonstrated  
“Moving Object  
Segmentation”  
and its implementation  
through VLIB functions  
on an embedded SoC***

# Thank you!

G. Dedeoglu, B. Kisacanin, D. Moore, V. Sharma, and A. Miller, “**An optimized vision library approach for embedded systems**”, *Proceedings of the Seventh IEEE Workshop on Embedded Computer Vision*, pp. 8-13, 2011 (CVPR).
